OVERVIEW

I am a Senior Software Engineer with deep experience building scalable, cross-platform applications and developer tooling. I have a proven track record in modernizing legacy systems, improving engineering velocity, and delivering high-impact features across web, desktop, and mobile platforms. Passionate about empowering developers through automation, clean architecture, and cloud-native solutions.

KEY PROJECTS & IMPACT

Legacy System Modernization: Led a team to transition a 16-year-old desktop application to a modern web/mobile architecture, delivering ahead of schedule.
Codebase Simplification: Orchestrated the deprecation of 16 legacy features, removing 545k lines of code with zero major regressions.
Release Engineering: Designed a branching strategy and release cadence still in use 10+ years later, enabling consistent and reliable product delivery.

SKILLS

Languages: C#, C++, TypeScript, Python, JavaScript, SQL, KQL
Backends & APIs: Node.js, .NET, RESTful APIs, Minimal API, Azure App Services, Microservices, Redis (Caching)
Frontend & UI: React, Web Components, HTML5, CSS3, WPF, WinForms, Performance Optimization
Tools: Git, GitHub Actions, Copilot (AI), Terraform, Puppet
Cloud & DevOps: Azure, CI/CD, Microservices, Containers, Monitoring and Alerting, Deployment
Practices: Agile, Scrum, Kanban, Test-Driven Development, Security Best Practices
Soft Skills: Leadership, Collaboration, Growth Mindset, Problem Solving, Creative Thinking.

EXPERIENCE

Logos Bible Software 12/2021 - Present · Remote *Senior Software Engineer*

Design and build the systems customers use to create and follow reading plans, from backend databases to frontend UI and the integration points between systems.
Ship features such as in-app audio and video across multiple platforms.
Work heavily with AI to **speed up development**, while improving the **consistency and accuracy** of how the team uses it.
Previously led a team that was converting 16 years' worth of product design/delivery from a local desktop application into a Web/Desktop/Mobile implementation. We were **building for scale and performance** using

TypeScript/React and many custom microservices. While I led it, that team had the highest sprint velocity per person and lowest bug count across our dev organization.
Led a team tasked with shutting down 16 products/features that were deeply integrated throughout our eco-system. Our team **deleted 545k lines of code** in a live customer facing product without a single major negative user facing consequence. **Improved Sprint velocity per person from 6.9 – 11.3** while leading. Helped improve severe morale issues on both teams. Had zero people leave the company during my time in leadership in these positions.
While not leading teams, I've functioned as a key contributor on our flagship software Logos Bible Software: **"Ryan single-handedly improved per person velocity by joining the team"**
Skilled in cross-team collaboration and consensus-building to drive aligned technical decisions.

LIFEchurch360 10/2020 - 11/2021 *Executive Pastor*
Designed and championed a change to our policy which gave vacation and Holiday pay to our many part time employees.
Instrumental in creating two years' worth of budgets in a time of uncertainty.
Led a team of 7 employees and was responsible for the **strategy and planning** for the $1+ million business side of the church.

Logos Bible Software 08/2011 - 10/2020 *Software Developer*
Led a development team of ~12 (responsible for 80-90% of the company's revenue) during 2 major product releases.
Architected and implemented a branching and release strategy that **improved release cadence** and reduced integration issues.
Devised and implemented a plan to ship a minor version update every six weeks. We did this using a hybrid of Agile/SCRUM and kanban.

PERSONAL

https://goalreacher.app: Built a secure personal finance tracker using Azure Cosmos DB and Minimal API; deepened expertise in cloud-native architecture and authentication.
https://codereviewtrainer.com: An application to help developers improve their code review skills. Developed with GitHub Copilot to explore AI-assisted development and prompt engineering.
https://skullk.ing: Designed a real-time scoring system with live updates and backend data consistency; improved skills in distributed systems and state management.

EDUCATION

City University BS in Computer Science · 2005
